

GitHub Guide & Submission Instructions for Interns

Introduction

Throughout the DStarix Generative AI Internship Program, all assignments and projects must be managed and submitted through GitHub. Using GitHub will help you learn industry-standard version control practices, maintain a record of your work, and showcase your projects professionally.

Creating Your GitHub Account

If you do not already have a GitHub account, create one before starting your internship tasks. Ensure that you have access to your account throughout the internship period.

Repository Requirements

For each weekly assignment, create a separate GitHub repository.

Repository names should be clear and descriptive.

Examples:

- week-1-ai-chat-assistant
- week-2-langchain-customer-support
- week-3-rag-chatbot
- week-4-ai-research-agent

Repositories should remain accessible throughout the internship.

Required Files

Every repository should include:

- Complete source code
- README.md
- requirements.txt
- .gitignore
- Any additional project files required for execution

If your project uses environment variables, include a sample configuration file such as `.env.example`.

Important Security Guidelines

Never upload:

- API keys
- Passwords
- Secret credentials
- Personal information
- .env files containing real credentials
- Virtual environment folders
- Large unnecessary files

Always verify your repository before pushing code to GitHub.

Working with Git and GitHub

Follow a professional development workflow:

1. Create your project repository.
2. Develop your project locally.
3. Commit changes regularly.
4. Push updates frequently to GitHub.
5. Maintain a clear commit history.
6. Keep your repository organized and up to date.

Use meaningful commit messages that describe your changes clearly.

Examples:

- Initial project setup
- Added LLM API integration
- Implemented conversation memory
- Added document retrieval functionality
- Improved error handling
- Updated project documentation

Avoid vague commit messages such as:

- Update
- Changes
- Test
- Fix

README Guidelines

Every project repository must contain a README file with:

- Project Title
- Project Description
- Features
- Technologies Used
- Installation Instructions
- Setup Instructions
- Usage Guide
- Project Structure
- Example Outputs (Optional)

A well-written README is an important part of every software project.

Code Quality Expectations

Interns are expected to follow good coding practices throughout the internship.

Your code should be:

- Clean and readable
- Properly structured
- Well organized
- Easy to understand
- Properly documented where necessary

Always test your application before submission.

Weekly Submission Process

At the end of each week:

1. Complete the assigned task.
2. Push all project files to GitHub.
3. Verify that the repository is accessible.
4. Ensure all required files are included.
5. Submit the GitHub repository link as instructed by your mentor.

Only GitHub repository links will be accepted for assignment submissions.

Submission Deadlines

Weekly assignments must be submitted before the start of the following week.

Submission Deadline:

Every Sunday

All repository links must be submitted before Monday begins.

Late submissions may affect evaluation unless prior approval has been granted by the mentor.

After Submission

After submitting your repository:

- Keep the repository available.
- Do not delete the repository.
- Do not remove commit history.
- Do not make major modifications unless requested by your mentor.

Your repository may be reviewed during the internship.

Best Practices

To get the most out of this internship:

- Commit your work regularly.
- Push code frequently.
- Keep projects organized.
- Follow task requirements carefully.
- Write clear documentation.
- Test before submitting.
- Ask questions whenever you need guidance.
- Focus on learning and understanding the concepts being taught.

Submission Checklist

Before submitting your assignment, ensure that:

- The weekly task is completed.
- All code has been pushed to GitHub.
- README.md is included.
- requirements.txt is included.

- Sensitive information has been removed.
- The project runs successfully.
- The repository link is ready for submission.
- The submission is completed before the weekly deadline.

Following these guidelines will help you build professional development habits and prepare you for real-world software engineering and Generative AI projects.
